

In this topic, you will explore visualisation widgets that are a part of the dashboard. You will look at some of the frequently used graphs that will help you complete the tasks in the workshops for this week.

It is important to note that this week requires some amount of self-study to further develop these skills.

### Types of visualisation widgets

Visualisation widgets are also known as graphs, plots or charts. A dashboard is composed of multiple widgets that come together to create the interactive dashboard experience. As a data analyst, one of your primary roles will be to build widgets for such interactive dashboards.

Let's explore some of the frequently used graphs as preparation for the analytics tools workshops.

### Bar charts and stacked bar charts

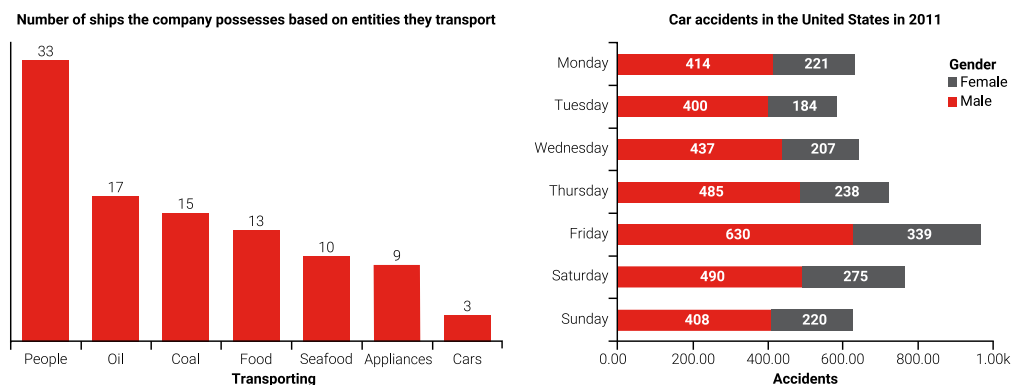

Bar charts and stacked bar charts are used to visualise a measure (numerical) with dimensions (categorical); that is, part-to-whole relationships, as shown in the image below.

While using this type of widget, some suggestions to keep in mind are:

- use a horizontal data label
- be consistent with colours and contracts
- rank data in ascending or descending order
- use scale clear to view.

### Scatter plots

Scatter plots are used to show a correlation between two measures (numerical variables), distribution trends, similarities in datasets and identify outliers, as shown in the image below.

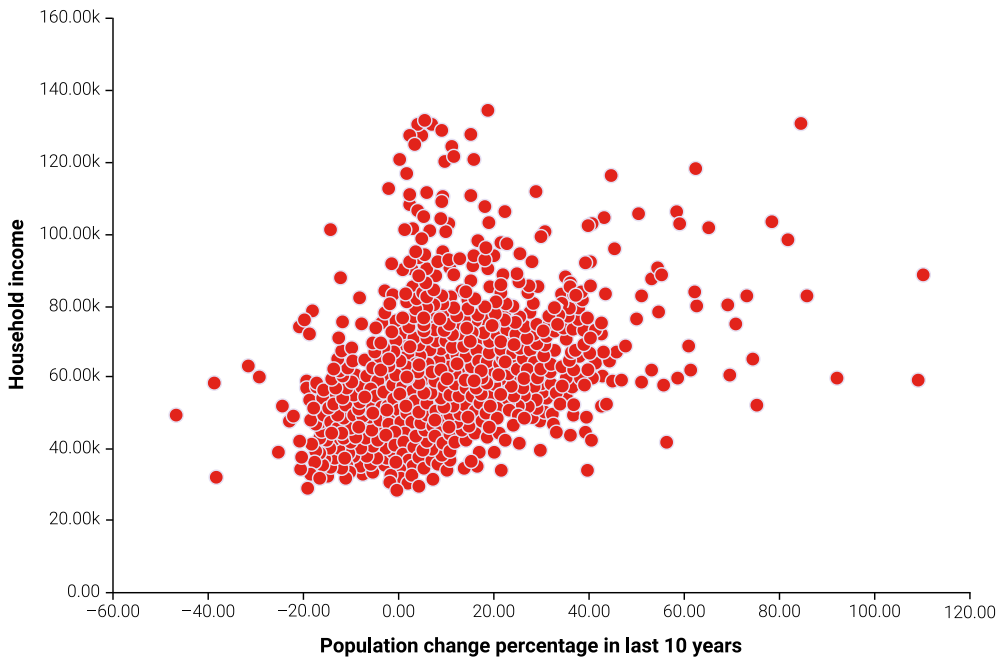

While using this type of widget, some suggestions to keep in mind are:

- use colours of dots but not too many
- keep the aspect ratio square.

Geo bubble charts

Geo bubble charts are used to view a measure by country, region or city and to compare measures across different geographic areas, as shown in the images below.

While using this type of widget, some suggestions to keep in mind are:

- show values on a map
- use animation
- mention clear labels.

**Tree maps and heat maps**

Tree maps and heat maps are used to compare quantities by categoricals using colour and size to show the distribution of measure values.

While using this type of widget, some suggestions to keep in mind are:

- use this only when there is a visible difference in colour intensities.
